

※ 考生請注意：本試題可使用計算機。 請於答案卷(卡)作答，於本試題紙上作答者，不予計分。

1. Store A sells meat measured by kilogram, and store B sells cellular phones. The following table shows the amount and money (NT\$1,000) sold in eight days for the two stores.

| Day | | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|---------|--------|-----|-----|-----|-----|-----|-----|-----|-----|
| Store A | Amount | 300 | 220 | 290 | 225 | 240 | 360 | 320 | 280 |
| | Money | 20 | 15 | 19 | 16 | 20 | 32 | 22 | 16 |
| Store B | Amount | 20 | 12 | 10 | 6 | 15 | 22 | 10 | 8 |
| | Money | 205 | 150 | 125 | 86 | 92 | 160 | 102 | 70 |

- (1) (10%) Which store has a more stable amount sold in a day?
 (2) (10%) Which store has a stronger linear relationship between the amount and money sold in a day?
2. The mayor of a city wants to know the attitude of citizens about a new policy. Define necessary symbols in answering the following questions.
- (1) (10%) Suppose that a citizen can either like or dislike the new policy. If 100 citizens are randomly chosen to express their opinions about the new policy, give the sampling distribution of the point estimator for measuring the attitude of citizens, and specify necessary conditions to have the sampling distribution.
- (2) (10%) Suppose that a citizen can give a score ranged from 1 to 10 to be his/her favorite level about the new policy, where score 10 represents the most favorable. If 25 citizens are randomly chosen for scoring, give the sampling distribution of the point estimator for measuring the attitude of citizens, and specify necessary conditions to have the sampling distribution.

3. Let A, B, and D be events, and let A^C be the complement of event A.

- (1) (5%) If A^C and B^C are independent, argue whether A and B are independent.
 (2) (5%) If A and B are independent, and B and D are independent, argue whether A and D are independent.

※ 考生請注意：本試題可使用計算機。 請於答案卷(卡)作答，於本試題紙上作答者，不予計分。

4、Comparison of visual acuity (clarity of vision) in diabetic patients and the matched healthy control group. Is the distribution of visual acuity different in the two groups? It should be noted that the distribution of visual acuity is not normal.

(1) Define the null and alternative hypotheses for the statistical test you plan to conduct (3%)

(2) Calculate the test statistic (10%)

(3) What is the p-value of the test (2%)

| Visual acuity ¹ | Diabetic patients (n) ² | Healthy control group (n) ² |
|----------------------------|------------------------------------|--|
| 20-20 | 5 | 11 |
| 20-25 | 10 | 6 |
| 20-30 | 6 | 5 |
| 20-40 | 4 | 4 |
| 20-50 | 3 | 7 |
| 20-70 | 2 | 4 |
| 20-100 | 0 | 2 |
| 20-200 | 0 | 1 |

Note: 1. In the case of visual acuity, "20-20" is the best (normal vision) and "20-200" is the worst (legal blindness).

2. "n" represents the number of people having that level of visual acuity based on the Snellen eye chart.

5. A clinical trial was conducted to test a new anti-depression medication. Thirty participants with a similar depression level (15 from a high school in the north of the island, 15 from a high school in the south of the island) were stratified and then randomly assigned to three groups with different dosage of the medication: 0mg (placebo), 50mg, and 100mg. Three month later, the effect of this antidepressant was self-evaluated on a scale of 1-10, with 10 being extreme helpful and 1 being useless. Please conduct a factorial ANOVA using α level = 0.05. The original data is provided as follows.

| School location | 0 mg | 50 mg | 100 mg |
|-----------------|------|-------|--------|
| North | 3 | 6 | 7 |
| | 5 | 5 | 7 |
| | 3 | 8 | 8 |
| | 2 | 6 | 5 |
| South | 3 | 7 | 8 |
| | 3 | 5 | 7 |
| | 1 | 7 | 9 |
| | 3 | 5 | 5 |
| | 2 | 6 | 7 |

(1) Give a complete ANOVA table. Does the interaction term in the model reach the significant level? (13%)

(2) Test the difference in the rating of treatment effect between the 50 mg and 100 mg. You should control overall experiment-wise error rate. (5%)

6. A teacher suspects that the final exam score in her operation research was related to the average quiz score and the midterm score. Moreover, she perceived some gender differences in class involvement. Therefore, she fitted a multiple regression model using Final as the response and included Quiz Average, Midterm, and Gender (Male/Female) as the predictors. The original data is not given here but the partial outputs of testing results generated by Minitab are provided as follows. It should be noted that the Gender predictor included in the model was dummy recoded as (1, 0) for (male, female).

Analysis of Variance

| Source | DF | Adj SS | Adj MS | F-Value | P-Value |
|--------------|----|---------|---------|---------|---------|
| Regression | 3 | 2683.79 | 894.60 | 9.13 | < 0.001 |
| Quiz Average | 1 | 1913.88 | 1913.88 | 19.53 | < 0.001 |
| Midterm | 1 | 1.47 | 1.47 | 0.02 | 0.903 |
| Gender | 1 | 19.15 | 19.15 | 0.20 | 0.661 |
| Error | 46 | 4506.93 | 97.98 | | |
| Total | 49 | 7190.72 | | | |

Coefficients

| Term | Coef | SE Coef |
|--------------|-------|---------|
| Constant | 12.6 | 15.3 |
| Quiz Average | 0.731 | 0.165 |
| Midterm | 0.024 | 0.193 |
| Gender | | |
| Male | -1.26 | 2.85 |

(1) Calculate the coefficient of determination and explain its meaning. (5%)

(2) How to obtain the coefficient value for the predictor "Quiz Average" (12.6 here) using other information provided in the table? (5%)

(3) Write down the final score prediction equation for male students. (2%)

(4) Compare (contrast) the p-value approach and the confidence intervals approach in hypothesis testing. (5%)
