國立成功大學 108 學年度碩士班招生考試試題

系　所：工業與資訊管理學系

考試科目：統計學

考試日期：0224，節次：3

※ 考生請注意：本試題可使用計算機。　請於答案卷(卡)作答，於本試題紙上作答者，不予計分。

1、(20%) Suppose that a random variable X has pdf

$$f_X(x) = \begin{cases} 6x(1-x), & 0 < x < 1 \\ 0, & elsewhere \end{cases}$$

Let Y be a second random variable, where $Y = 2X + 1$.

What is the pdf for Y?

2、(10%) Suppose that X and Y are independent random variables with the standard deviations $\sigma_X = 3$ and $\sigma_Y = 4$. Let $Z = Y - X$. Find the covariance $Cov(X,Z)$ and the correlation $\rho(X,Z)$ of X and Z.

3、(20%) A coin is thrown independently 10 times to test the hypothesis that the probability of heads is 1/2 versus the alternative that the probability is not 1/2. The test rejects if either 0 or 10 heads are observed.

(a) What is the significance level of the test?

(b) If in fact the probability of heads is 0.1, what is the power of the test?

※ 考生請注意：本試題可使用計算機。　請於答案卷(卡)作答，於本試題紙上作答者，不予計分。

4. In a manufacturing company, a new method to perform a production task is introduced. The company want to see if the new method can significantly reduce the mean task completion time. In choosing the sampling procedure used to collect task completion time. A matched sample design is used. Seven workers are randomly chosen to use the traditional and new method separately to complete a production task. Task completion times from each worker are recorded (in seconds) in the following table. It is assumed that the task completion time follows normal distributions.

Traditional method	56	66	67	58	69	62	63
New method	46	60	67	52	60	55	57

(1) **(5%)** Suppose that the task completion time using the *Traditional method* follows a normal distribution, $N(\mu_T, \sigma_T^2)$. Use the data from the table above and find a 95% two-sided confidence interval for the population variance, σ_T^2 (use the data from *Traditional method* row only).

(2) **(10%)** Analyze the data from this table. Formulate the hypotheses that can be used to determine if the new methods can significantly reduce the mean task completion time? Use $\alpha = 0.05$. Explicitly present your null hypothesis, test procedure and conclusion.

5. A cardboard cans manufacturer recently purchased a new machine for producing cardboard cans. He would like to conduct a hypothesis testing to see if the fraction of nonconforming cans, *p*, produces by this machine is acceptable. A nonconforming can may leak around the bottom of the can. To conduct this test, he decides to take a sample with sample size, *n*, from the manufacturing process and thus the number of nonconforming cans (*X*) in this sample is a random variable. If there are more than *r* nonconforming cans in the sample, he will conclude that the fraction of nonconforming cans is not acceptable and he has to adjust the settings of this machine. However, he does not know how to choose appropriate number of *n* and *r*.

(1) **(16%)** Use the normal approximation of the distribution of *X* and use the following conditions to determine the smallest value of *n* and the corresponding value of *r*:
(i) If the true fraction of nonconforming cans is 0.1, the probability of $X \geq r$ is smaller than 0.05.
(ii) If the true fraction of nonconforming cans is 0.2, the probability of $X \geq r$ is greater than 0.95.
Find the closest positive integer combination of *n* and *r* satisfying the previous two conditions.

(2) **(4%)** Based on your solutions in (1), to test $H_0: p \leq 0.1$, the rejection region is $\{X \geq r\}$. When $p = 0.25$, what are the probability of Type II error and the power of this test?

6. The following data is from a completely randomized design.

	Treatments		
	A	B	C
	162	142	126
	155	145	124
	153	140	122
	165	155	138
	170	155	135
Sample mean	161	147	129
Sample variance	50	51	50

(1) **(6%)** Before conducting an ANOVA analysis to the data, what are the assumptions required for the observed data?

(2) **(9%)** Use the data from the table, at the $\alpha = 0.05$ level of significance, set up the ANOVA table and test whether the means for the three treatments are equal?

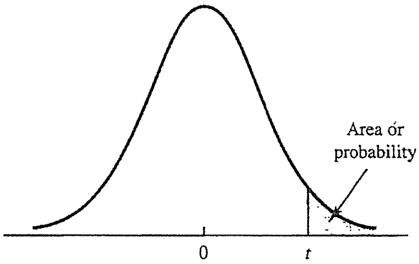
Percentage points of the t-distribution



Entries in the table give t values for an area or probability in the upper tail of the t distribution. For example, with 10 degrees of freedom and a .05 area in the upper tail, $t_{.05} = 1.812$.

Degrees of Freedom	Area in Upper Tail					
	.20	.10	.05	.025	.01	.005
1	1.376	3.078	6.314	12.706	31.821	63.656
2	1.061	1.886	2.920	4.303	6.965	9.925
