

- Describe the following terms from biomechanical point of view.
  - Lag Screw effect
  - Compression hip screw
  - Double locking phenomenon (gait)
  - Tension band
  - Double support (gait)
- Describe the significance of medullary cavity for the mechanical stressing to tubular bone.
- Fig. 3-a is a mode of bending stress provoked by the eccentrically body weight. Draw the modes of bending stress in Fig. 2-b, Fig 3-c, and Fig 3-d.
- A patient applies a 150 N force to a cane as shown in Fig. 4 with the elbow at an angle of  $30^\circ$  to vertical. What force is require by triceps and what is the joint force? The distance from the triceps insertion to joint center is assumed to be 3 cm and the distance from joint center to cane is 26 cm. The weight of the forearm is relatively insignificant and can be neglected.
- A posture as shown in Fig. 5 and the kinematic and anthropometric data are :
 

$h = 30 \text{ cm}$	$\theta_H = 30^\circ$	$\alpha = 60^\circ$
$b = 20 \text{ cm}$	$\theta_T = 40^\circ$	$D = 11 \text{ cm}$ $E = 5 \text{ cm}$

$m_{gbw} = 350 \text{ N}$  (above L<sub>5</sub>/S<sub>1</sub>, level),  $m_{glud} = 450 \text{ N}$

The moment at hip for an average anthropometric male in this posture is found to be 200 Nm. Abdominal Pressure is empirical predicted by :

$$P_a = 10^{-4} [43 - 0.36 (\theta_H + \theta_T)] [M_H^{1.0}]$$

The diaphragm area is assumed to be  $465 \text{ cm}^2$

Find  $F_a$ ,  $F_{musc}$  and  $F_{comp}$ .
