

(一) A long, straight coaxial cable (see fig. 1) has an 15% inner wire of radius  $r_a$  that carries a linear charge density  $\lambda$  ( $C/m$ ), and an outer cylindrical shell of radius  $r_b$  that has a linear charge density  $-\lambda$ .

(1) Find the electric field in the regions ①  $r < r_a$

②  $r_a < r < r_b$  ③  $r > r_b$

(2) Find the electric potential in the regions ①  $r < r_a$  ②  $r_a < r < r_b$  ③  $r > r_b$

(3) Find the capacitance of a length  $l$  assuming that air is between the cylindrical capacitor?

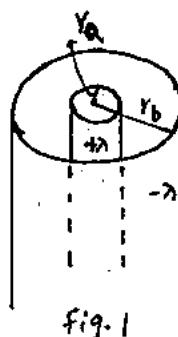

fig. 1

(二) Water drains through an opening of area  $A_1$  in a 10% container of cross-sectional area  $A_2$ , (see fig. 2) If the motion of water surface in the container is not ignored, find the speed  $v = ?$  at which the water emerges.

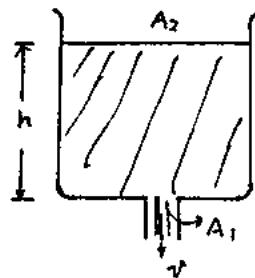

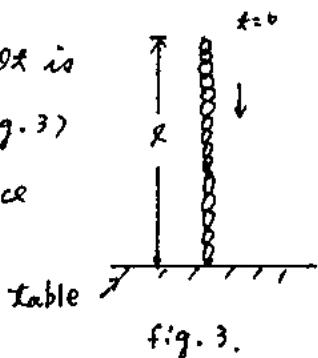

fig. 2

(三) A vertical chain has a length  $l$  and a mass  $M$ . It is released with the bottom just touching a table; (see fig. 3) Find ① the force on the table as a function of the distance fallen by the top end?  
② the maximum force on the table?

Table

fig. 3.

(四) A 5kg block has a rope of mass 2kg attached to its underside and a 3kg block is suspended from the other end of the rope. (see fig. 4) The whole system is accelerated upward at  $2 \text{ m/sec}^2$  by an external force  $F_0$   
① what is  $F_0$ ?  
② what is the net force on the rope?  
③ what is the tension at the middle of the rope?

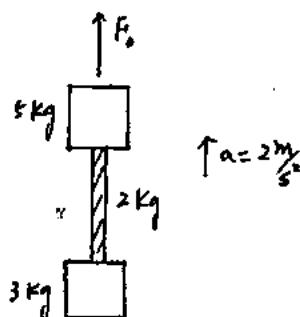

fig. 4

(三) A marble of radius  $r$  rolls without slipping

15% down an incline and then up along a vertical circular track of radius  $R$ . (See fig. 5)

What is the minimum height  $H$  from which the ball must start so that it barely stays in contact at the top of the circle?

assume  $r \ll H$ ,  $r \ll R$ .

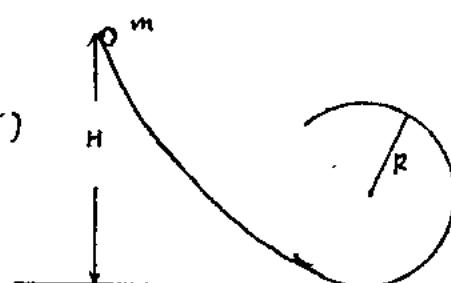

fig. 5.

(七) The current,  $I_1$ , in a long, straight wire changes

10% in time. The current  $I_2$  induced in the nearby loop, (see fig. 6), flows from a to b in the resistor.

If a voltmeter is connected between a and b, what will it read?

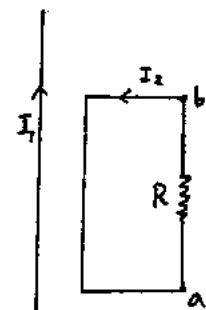

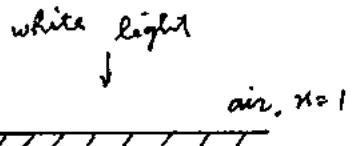

fig. 6.

(九) White light is incident normally on a

10% glass ( $n = 1.52$ ), that is coated with a film of  $MgF_2$  ( $n = 1.38$ ). For what minimum thickness of the film will

yellow light of wavelength  $5800\text{\AA}$  (in air) be missing in the reflected light?

$MgF_2 \rightarrow \text{film layers}$   
 $n = 1.38$

glass,  $n = 1.52$

(十一) One mole of an ideal monatomic gas is

15% caused to go through the cycle (see fig. 8)

① How much work is done in expanding the gas from a to c along path abc?

② What is the change in internal energy and entropy in going from b to c?

③ What is the change in internal energy and entropy in going through one complete cycle?

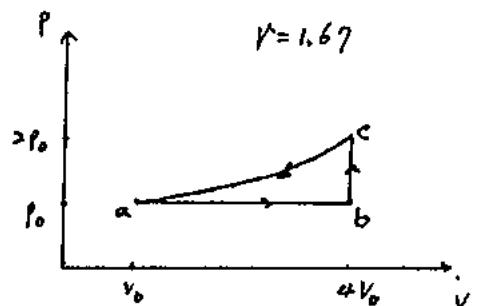

fig. 8

point a :  $(P_0, V_0, T_0)$
