※考	生請注意:本試題 □ 可 □ 不可 使用計算機 請勿在本試題紙上作答,	否則不予計分
*	本試題共計4頁。作答時可不必抄題,但請必須將各題之題號標註清楚。	
*	Note that throughout the paper, the height of a binary tree with only one node is c empty binary tree has height of zero.	lefined as 1 while an
1.	是非題 (16分; 每題作答正確則得 2分, 作答錯誤則得 0分並倒扣 1分, 元 For each question from (1-1) to (1-8), mark T (or 〇) if the statement given is otherwise. Note that you will earn 2 points for each correct answer and lose 1 po answer. You earn no point if you do not give any answer.	s true, mark F (or x)
	(1-1) If a problem can be solved by a recursive algorithm, then the problem iterative algorithm with the same time complexity.	can be solved by an
	(1-2) For sequential search, searching a data item in a data list sorted by the key worst case performance than searching in an unsorted data list.	values shows better
	(1-3) The ADT (Abstract Data Type) of sparse matrix can be used for the ADT of	f general matrix.
	(1-4) Hashing can be applied to developing a sorting algorithm of time compl $O(n\log_2 n)$ where n is the number of data items.	lexity no worse than
	(1-5) The relation among all the members of a family can be represented by a dir	ected graph.
	(1-6) Heap sort algorithm belongs to the category of selection sorting.	
	(1-7) Given a graph G , if there is a vertex v of G such that DFS(v) spanning tree spanning tree of G , then G is also a tree structure.	ee is also the $BFS(v)$
	(1-8) When creating a B-tree from a list of data items, the data items must be a key values.	already sorted by the
2.	選擇題 (16分,每小題2分) For each question from (2-1) to (2-8), please give all appropriate items as the an Note that there might be two or more appropriate items and you must give all a points. In case you believe that no appropriate item is listed, then give <i>F</i> as your (2-1) Listed below are statements about <i>array</i> in computer programming and dat ① <i>Array</i> can be used to implement the data type of character strings of var ② <i>Array</i> can be used to implement the data type of complex numbers in m ③ The components of an <i>array</i> do not need to be of the same data type and ④ <i>Array</i> can be used to implement linked list and <i>array</i> can be implement ⑤ The number of dimensions of an <i>array</i> is only limited by available mem Based on the above, which is/are true? (A) ①④ are correct. (B) ②④ are correct and ③ are incor	such items to get the answer. a structures: tiable length. athematics. d the same size. ed by linked list. mory storage.

- (C) @(S) are incorrect.
- (E) (D) is correct and (3) is incorrect.
- (2-2) Which of the following statements is/are true?
 - (A) Priority queue is a data structure with FIFO property.
 - (B) Given a binary tree T of n_0 leaves, the threaded binary tree of T has $(2 \cdot n_0)$ threads.
 - (C) Given an AVL tree T of n nodes, the time complexity of doing LL and RR rotations on T are the same as that of doing LR and RL rotations on T.
 - (D) = x + y z is the prefix representation of the infix expression x = y + z.
 - (E) None of the above is true.

3. On merge sort, please do the following:				
(3-1) Derive its time complexity using recurrence relation. (6 poin	ts)			
(3-2) Is merge sort a stable sorting algorithm? Prove your answer.	(6 points)			
 4. Given the complexity of F₁ is O(n²) and that of F₂ and F₃ are respendent of G is a compound function of F₁, F₂ and F₃ and G = F₁ + F₂ · F₃, the (6 points) 				
The C function popMinHeap() given below is supposed to delete the smallest integer from a min heap which is stored in an integer array heap[]. After executing popMinHeap(), the heap remains as a min heap structure. Variable n indicates the number of keys contained in array heap[]. Unfortunately, popMinHeap() has some bugs. Please correct all the bugs in the program. DO NOT rewrite the entire program, just show your modification with the line number. (10 points)				
<pre>l int popMinHeap(int *n, int* heap) 2 { int parent, child, min, tmp;</pre>				
3 $\min = heap[1];$ $tmp = heap[n];$ 4 $parent = 1;$ $child = 2;$				
5 while (child $< *n$) {				
6 if $((child \le *n) \&\& (heap[child] > heap[child])$	child + 1]))			
7 child++;				
 8 if (tmp > heap[child]) break; 9 heap[parent] = heap [child]; parent = cliphing 	hild:			
10 child = parent*2; }	111143			
11 hear [manent] terres				
11 $heap[parent] = tmp;$				
$11 \qquad \text{neap[parent]} = \text{tmp;} \\12 \qquad \text{return min;} \\13 \qquad \}$				

- 6. For each of the terms below, please give its definition or explanation. (9 points, 3 points each)(1) Eulerian walk (2) Strongly connected graph (3) Balance factor of AVL tree
- 7. Suppose you are given a set of alphabets and their frequencies below. (5 points)

Alphabet	а	e	h	1	р
Frequency	15K	10K	2K	4K	7K

- (1) Construct the Huffman encoding tree step-by-step based on the table. (3 points)
- (2) Encode the message "alpha" using the Huffman encoding tree. (2 points)

(背面仍有題目,請繼續作答)

國立成功大學一○○學年度碩士班招生考試試題

系所組別: 電機工程學系丁組、電腦與通信工程研究所甲組

考試科目: 資料結構

考試日期:0220,節次:2

※ 考生請注意:本試題 □可 ☑不可 使用計算機

- 8. 複選題: (15 points)
 - (8-.) Given a preorder traversal sequence of a binary search tree T as

41, 20, 8, 32, 25, 63, 55, 49, 44, 68, 65.

Which of the following statement(s) is (are) true? (5 points)

- (A) The number of leaf nodes in the tree T is 4.
- (B) If the tree T is traversed by postorder traversal, the first node visited is 8.
- (C) The height of T is 4.
- (D) The tree T is not an AVL tree.
- (E) The tree T cannot be uniquely determined.

(8-2) Given an undirected graph G(V, E) where the number of vertexes is n and the number of edges is m. Which of the following statement(s) is (are) true about the graph G? (5 points)

- (A) If G is represented by adjacency matrix, the space complexity is $O(n^2)$.
- (B) If G is represented by adjacency list, the space complexity is O(m).
- (C) If G is represented by adjacency list, the time complexity to determine whether G is connected is O(m).
- (D) If G is connected, then $n \ge m + 1$.
- (E) If G is represented by adjacency list, the time complexity for determining whether every vertex in G has at least two paths to any other vertex in G is $O(n^3)$
- (8-3) Arrange the following functions by growth rate in increasing order.
 - $n, \log(n!), n^2, n \log(\log n), 2^{1000}, 2^n, n^2 \log n, n^3, n!, (\log n)^{\log n}$

Based on the increasing order arrangement, which of the following statement(s) is (are) true? (5 points)

- (A) 2^n is located at the last position.
- (B) $n^2 \log n$ is located at the fifth position.
- (C) $(\log n)\log n$ is located before n^3 .
- (D) $\log(n!)$ is located before n^2 .
- (E) n^3 is located at the seventh position.
- 9. Given a hash table of 11 buckets, labeled from 0 to 10. Each bucket can hold only one key. The hash function h(key) = key % 11. Chaining is used in the hash scheme. Now, suppose the hash table is initially empty and then the numbers "3, 41, 15, 36, 74, 58, 91, 45, 48, 64" are hashed sequentially into the hash table. (11 points)

(1) Show the hash table after inserting the sequence of numbers, (3 points)

(2) What are the average comparisons if each number of the sequence is looked up once? (3 points)

- (3) In general, what is the worse-case time complexity for hashing in such a hash scheme? (2 points)
- (4) If the worse-case time complexity of hashing need to be improved to $O(\log n)$, how ? (3 points)
